Hi Johan,
Thanks for being willing to participate. Here are some responses to your questions, in the same order that you ask them.

- it is no problem if you do not remember details; I do not think any changes at all are needed.
- yes, we are happy to reconstruct the kernels.
- the coordinates are the critical piece that we need, so if it is difficult to get soil moisture etc., please do not worry about this.
- with respect to authorship— First, we would be very happy to have you (and/ or Jon) as an author. Our thinking on the subject was this: we are using data from three sources: 1) COMPADRE; 2) matrices from the supplemental information of manuscripts, and 3) we are emailing corresponding authors to obtain matrices if they did not present them on COMPADRE or in their manuscript. #1 and 2 are freely available, but #3 is not. It did not seem 'fair' to us to offer authorship to those people that we emailed, but to not offer authorship to people whose matrices are on COMPADRE or in their supplemental information. All that said, a few people are interested in being authors and we will happily include them (tentatively so far, this includes Pascarella, Crone, and Ramula). We would be happy to have you and I think your perspective would improve the manuscript if you are interested in being an author.

Best,
Allison

I have now discussed with Jon Ågren, my collaborator on this study, and we are willing to provide the data. However, before doing so I have a few questions.

- This study was done more than 10 years ago by a PhD student, so my memory of the details is quite vague, and it would not be easy to make changes if such are needed.

- Our data is available as 48 files with code (one per population x year), and 24 data files (one per population). I could send these without problems but I am not sure how that would fit in your template, i.e. we have no matrices although these could easily be derived using the code and the mesh points should be the same.

- We have several environmental variables for each population (soil moisture, veg height, soil depth, N, C, P, K, Ca & Mg), and coordinates should be possible to derive.

- What do you mean by "If authorship is a concern, let me know and we can discuss further.". I assume that just providing the data does not merit authorship!?

Very best,

Johan

Hi Johan,
Sorry for my very late response; I have been dealing with two sick kids at my house. This sounds great. Thank you so much for being willing to participate.

An addendum to my previous email is that each population's kernel must have identical bounds & meshpoints (i.e., the same size classes across all populations).

Best,
Allison

This is fine with me, but I will have to contact my collaborator on this and ask if he agrees to share the data.

Best,

Johan

Subject: Opportunity to contribute to synthesis of multiple-population studies: Euler et al 2014

Hi Johan,

I hope this email finds you well. Our group is working on a meta-analysis looking at across-population variation in sensitivity to matrix elements. Our goal is to quantify changes in sensitivity across multiple populations of one species. We are looking for studies that have constructed structured population models at two or more populations, and we aim to obtain matrices from these studies to estimate sensitivities. Your paper "Environmental context influences both the intensity of seed predation and plant demographic sensitivity to attack" satisfies this criterion, and we are wondering if you would like to contribute to our meta-analysis.

If you are interested, we would need the matrices from populations 1-24 (please, no code— just matrices), as well as the latitude and longitude of each population. We may try to ask additional questions about the drivers of sensitivities (if we have enough data). So, if there are population-specific environmental data you would like to send us that are not in the published paper, we would welcome those too— we just need one value per population for any environmental data. We have attached a template for data entry that also contains instructions on how to fill it out (in the README tab). If you would like to participate in our meta-analysis, please send us your data in this template by October 25. If your study contains multiple species, please fill out a separate excel file for each of those species.

I'm happy to address any questions or concerns. If a month is not enough time, please let us know. If authorship is a concern, let me know and we can discuss further. Note that our data entry form provides a space for you to indicate whether you are comfortable with your matrices being published or not, so if you don't want them shared publicly, that would work fine for us.

Thank you for considering participating in our work.

Best,
Allison Louthan (with Thomas Leihsing, Natalie Miller, Sarah Herzog, and Aleah Querns)
